Healthy Secrets, Laravel build spec for Josh

Written 27 Oct 2026 for Josh (build) and Raka (scope and price). Everything below is either read from a source today and named, or marked as a decision or an input we still need. Nothing is guessed. Where a source disagrees with another source, both are quoted.

Client. Healthy Secrets OG, FN 661029 b, UID ATU82537658, Dannebergplatz 19, 1030 Wien. Partners Dr. Stephanie Walkner, Dr. Nikolaus Walkner, Leonie Walkner BSc. Contact office@healthysecrets.at (shared inbox, Leonie accepted the call invite from it). Café, the Gut Health Club, at Wildpretmarkt 1, 1010 Wien, open since 17 Oct 2026.

What exists already. A front end prototype, 9 pages, German and English, live at https://astra-healthy-secrets-prototype.netlify.app . Source in this repo at `state/prototypes/healthy-secrets/build/` (page sources `build/pages/*.html`, generator `build/build.py`) and the built output at `site/` (`site/assets/site.css` 66 KB, `site/assets/site.js` 26 KB, self hosted Jost fonts, 29 images). Design notes and every open content point are in `handover.md` next to this file. The prototype has **no back end**. Cart, checkout, booking and forms are front end only.

What was agreed on the call (27 Oct, transcript in `logs/meetings/2026-10-27-HealthySecrets-call.md`).

1. The site they saw, rebuilt for real and moved off Wix. Mobile has to work as well as desktop.
2. They edit products, prices, descriptions, stock and photos themselves in a back end, "log in and change 1 euro to 1,10". Homepage text and anything that breaks goes through Astra.
3. Seasonal changes they can run themselves, their examples "this product reduced by 15% for Christmas" and "a bundle of products A, B, C".
4. Leonie's consultation booking. A blog (Leonie asked during the call).
5. Keep the domain healthysecrets.at and keep their search ranking.
6. A safe payment provider. Mollie or Adyen were named. They use credit card and Klarna today.
7. Newsletter, two sides. Raka said they could run a newsletter themselves from the back end. Nikolaus answered that he deactivates newsletters because they're annoying. So no newsletter in phase 1 unless they ask for it.
8. A contact form that sends to their email ("workflows ... if they have a question, it can be directed to your email").

9. Price. On the call Raka said "under 500 euros", "450 in total" (350 build plus 100 implementation). After the call Raka set the build at **500 euros** (27 Oct, "i wanna start it at 500 euros its fine"). About two weeks, maintenance from 50 euros a month. The summary email sent 27 Oct 19:42 UTC promised only "a proposal in the upcoming days", no price and no scope.

---

0. Read this first, Raka

The scope below is bigger than 500 euros of build time. A real webshop with payments, VAT, invoices, emails, an admin, a blog, bookings and a domain migration is weeks of work. Section 11 splits it into a phase 1 that keeps every promise from the call and a phase 2 for the rest. Decide the cut before Josh starts and before the proposal goes out.

Six decisions are yours (section 12). The client inputs Josh can't build without are in section 13. The two biggest blockers are the **food information per product** (law, section 6.2) and the **shipping model** (the live site and their own AGB disagree, section 6.4).

---

1. Stack (versions checked on Packagist, 27 Oct 2026)

Part	Choice	Version and why
Framework	Laravel 13	v13.39.0 published 27 Oct 2026, requires PHP ^8.3
PHP	8.4 minimum	Laravel 13 needs ^8.3, but spatie/laravel-translatable 6.15.0 needs ^8.4, so 8.4 is the floor
Database	MySQL 8 (or MariaDB)	Forge provisions it on the server
Admin panel	Filament 5	filament/filament v5.11.0, 26 Oct 2026, its support package accepts Laravel ^11.28, ^12 or ^13. Fastest way to give three non technical owners a clean back end with roles
Payments	Mollie, `mollie/laravel-mollie`	v5.0.0, 16 Oct 2026, supports Laravel ^11, ^12, ^13, PHP ^8.2, wraps `mollie/mollie-api-php` ^4.0
Translations of content	`spatie/laravel-translatable`	6.15.0, 19 Oct 2026, supports Laravel ^12 and ^13, needs PHP ^8.4. JSON columns per field, `de` and `en`
Translations in the admin	`lara-zeus/spatie-translatable`	2.0.1, 23 Apr 2026, requires Filament ^5. The official `filament/spatie-laravel-translatable-plugin` is abandoned on Packagist (last v3.3.57) and points to this one
Front end	Blade templates plus the prototype's own CSS and vanilla JS	No SPA. The prototype is already plain HTML, CSS and JS, keep it that way
Assets	Vite (ships with Laravel)	Content hashed file names replace the prototype's `?v=` cache busting
Queue	Laravel queue, database driver	Emails, PDFs and webhooks run on the queue. Redis is not needed at this size
Images	Upload in Filament, resize to WebP on save	Pick the package at install time and pin it, check it supports Laravel 13 first

Anything not in this table that Josh adds, check its Laravel 13 support on Packagist before requiring it.

---

2. Front end, page by page

Rule one. Keep the design exactly as it is. Raka and the client approved this version (v3, deploy 6ad62bdf0565e1544bbba75f). Port the markup into Blade and keep `site.css`. Don't restyle anything.

Some screens don't exist in the prototype and need a design in the same style, built from the prototype's own parts (type, colours, buttons, the shop dialog's layout). Product page, blog list and article, legal pages, the "checking your payment" page, a coupon field in the cart, the shipping method step, EPS and Apple Pay in the payment step, bundle cards, sale and unit prices. **Josh screenshots each new screen at 390 and 1440 px and sends them to Raka before building the next one.**

Rule two. Nothing about shipping is hard coded. The prototype says "inkl. Versand", "Versand inklusive" or "free shipping in Austria" in `build.py`, `index.html`, `shop.html` (twice) and `kasse.html`, on product cards, in the planner, the checkout aside and the shop meta description. All of it comes from the shipping settings once the client decides the model (6.4).

Rule three. One host. Today `http://healthysecrets.at` and `https://healthysecrets.at` both 301 to `https://www.healthysecrets.at/` (curl, 27 Oct). Keep **www** as the canonical host so every indexed URL keeps its host. Apex and http 301 to `https://www...`. Canonical tags and the sitemap use www.

Rule four. Languages move to the server. The prototype puts both languages in the page and swaps them with JS (`.l-de` and `.l-en` spans, `build.py` header comment). That's fine for a demo and bad for search, because Google sees both languages on one URL. In Laravel, render one language per URL.

- German is the default with no prefix, `/shop`. English lives under `/en`, `/en/shop`. Same slugs in both.
- Every page outputs `<html lang>`, `hreflang="de"`, `hreflang="en"` and `hreflang="x-default"` (pointing at German), and a canonical URL.
- The DE and EN switch in the header becomes two plain links to the same page in the other language. Remove `setLang()` and the `hs-lang` localStorage logic from `site.js`, and the `?lang=` handling in the page head (`build.py` line 249). Old `?lang=en` links redirect to the `/en` URL.
- When a product or post has no English text, the `/en` page falls back to German and carries `noindex`, so search doesn't index half translated pages.
- The legal links in the prototype (`AGB` and `DSE` in `build.py`) point at the Wix PDFs. In Laravel they point at `/agb` and `/datenschutz`.
- Fixed interface text goes in Laravel lang files (`lang/de/*.php`, `lang/en/*.php`). Content the client edits (products, blog, booking services, settings) is translatable in the database.
- Their AGB section 3 says the contract language is German only. The English checkout shows one line saying so. It's already in the prototype, keep it.

2.1 Routes

Route (DE, EN adds `/en`)	Prototype file	What becomes dynamic
`/`	`index.html`	Products in each hour come from the database (by their time slot). The events form comes out in phase 1 (see 2.3)
`/club`	`club.html`	Opening hours and the café menu from settings. The map stays a static SVG (OpenStreetMap data, keep the credit line, it's required by the ODbL licence)
`/shop`	`shop.html`	Product grid from the database, grouped by time slot, filter by slot. Quick view dialog stays
`/shop/{slug}`	new, built from the shop dialog	Full product page with every legal food field (section 6.2), price, unit price, VAT note, add to cart. Needed for search and for the law
`/kasse`	`kasse.html`	Real checkout (section 4)

Route (DE, EN adds `/en`)	Prototype file	What becomes dynamic
`/kasse/danke/{order}`	the success state inside `kasse.html`	Order received page, signed URL
`/beratung`	`beratung.html`	Services and prices from the database. Booking request form (section 5)
`/wissen`	`wissen.html`	Static content, the fibre chart and the day planner stay as built
`/ueber-uns`	`ueber-uns.html`	Static
`/handel`	`handel.html`	Trade enquiry form, saved and emailed
`/blog`, `/blog/{slug}`	new	List and article pages in the same design (headline, date, image, body). Phase 1 per Raka, see section 11
`/kontakt`	new	Contact form, promised on the call
`/impressum`	`impressum.html`	Company data from settings
`/agb`, `/datenschutz`, `/widerruf`, `/versand`	new	Legal pages as HTML, text supplied by the client (section 6.6). Each also offers the PDF download

2.2 Interactive parts to port (all in `site/assets/site.js`)

Part	Today	In Laravel
Day dial (sun and moon over the home page hours)	JS, scroll driven	Keep as is
Reveal on scroll	JS	Keep as is
Mobile menu	JS	Keep
Cart drawer, counter, toast	localStorage `hs-cart`, prices from an inline `P` JSON	**Server side cart in the session.** The drawer reads and changes it through small JSON endpoints (`POST /cart/items`, `PATCH /cart/items/{id}`, `DELETE /cart/items/{id}`, `GET /cart`). Prices, discounts and totals always come from the server. Never trust a price sent by the browser
Product filter by hour	JS	Keep, data attributes come from the database
Product quick view dialog	JS	Keep, plus a link to the full product page
Day planner quiz	JS, picks products and computes a cost per day, for example Matcha 44/14 plus Moon Milk 25/14 equals 4,93 € a day. It hard codes product keys (`lullaby`, `moon`, `slim` and the rest) and two swaps, St John's wort out if the visitor takes medication (`med`), caffeine out in pregnancy (`preg`), `site.js` lines 297 to 303	Keep. Products get a stable `planner_key` and two flags, `warn_medication` and `warn_pregnancy`, and the planner reads those instead of names. Prices and `portions` come from the database. "Add all to cart" calls the cart endpoint
Fibre chart tabs	JS, ARIA tabs with arrow keys	Keep
Multi step forms (checkout, booking)	JS steps plus client side validation	Keep the steps for the feel. **Validate again on the server**, always
Form success states	Fake order number `HS` plus the time	Real number from the server

2.3 Forms in the prototype, with their exact fields

Form	Fields (prototype `name`)	Becomes
Checkout `data-form="order"`	vorname, nachname, mail, strasse, plz, ort, land (AT, DE, IT, other EU or EEA), tel, zahlung (karte, klarna), alter (18 plus), agb	The real checkout, section 4
Booking `data-form="booking"`	leistung (therapie, bia, beides), tage (mo to fr), zeit (vormittag, nachmittag, abend), vorname, nachname, mail, tel, anliegen, nachricht, ok (consent including health data)	Booking request, section 5
Contact (new, promised on the call)	name, mail, message, consent	`/kontakt` page and a short form in the footer, saved as `enquiries.type=contact`, emailed to office@
Trade `data-form="trade"`	firma, art, name, land, mail, tel, p (fibre, muesli, brot, tee, alles), nachricht, ok	Saved as an enquiry, emailed to office@
Events `data-form="events"` on `/` and `/club`	vorname, mail, int (workshops, vortraege, kochkurse), thema (club page only), ok ("happy for Healthy Secrets to email me about this")	**A mailing list in law.** Phase 1 removes it from `/` and `/club`. If Raka and the client want it, phase 2 builds it with double opt in (section 6.5)

Every public form gets CSRF, a honeypot field, a time trap and rate limiting per IP. No reCAPTCHA by default, it sends data to Google and needs consent.

---

3. Back end

3.1 Data model

All money is stored as integer cents. All texts the client writes are translatable (`de`, `en`).

Table	Fields
`products`	id, slug, planner_key, warn_medication bool, warn_pregnancy bool, name*, subtitle*, lead*, category_id, time_slot (morgen, nachmittag, abend, nacht), price_cents (gross), tax_rate_id, cost_cents (admin only), weight_g, max_qty_per_order, low_stock_threshold, sku, stock (cached sum of `stock_movements`), track_stock bool, net_quantity (number), net_unit (g, ml), portions (null or number, used by the planner), ribbon*, is_active, sort, seo_title*, seo_description*, timestamps
`product_food_info` (one to one)	ingredients* (allergens marked), allergens*, may_contain*, quid* (percentages of named ingredients), nutrition_per_100 (energy kJ and kcal, fat, saturates, carbohydrate, sugars, fibre, protein, salt), preparation*, storage*, warnings*, operator_name, operator_address, origin* (where required)
`product_images`	product_id, path, alt*, sort
`stock_movements`	product_id, quantity (+ or -), reason, order_id or user_id, batch_id, note, created_at. Stock is the sum of these (3.2 B)
`stock_batches`	product_id, lot_number, best_before, quantity_in, created_at. P1 records them on stock in, P2 tracks them per order
`categories`	id, slug, name*, sort
`tax_rates`	id, name, rate (4.9, 10, 13, 20). Each product picks one. **The client's accountant sets the rate per product** (section 6.3)
`bundles`	id, slug, name*, description*, price_cents, image, is_active, starts_at, ends_at. The saving is computed against the sum of the single prices, never typed in. Shown as cards on `/shop` in their own "Sets" row above the hours, and in the cart as one line with its products listed under it

Table	Fields
`bundle_items`	bundle_id, product_id, qty. Stock comes off the products inside
`coupons`	id, code, type (percent, fixed), value, min_order_cents, starts_at, ends_at, max_uses, max_uses_per_email, applies_to (all, products, categories, bundles), excludes_sale_items bool, is_active. Pivot tables `coupon_product` and `coupon_category`. AGB section 4 says promo codes are once per customer, household or delivery address, so check email and address
`sales` (timed price change)	id, name, percent_off, product or category scope, starts_at, ends_at. Covers "15% off for Christmas" without touching base prices. The struck through price shown during a sale comes from `price_history` (6.1), never from a typed field
`shipping_zones`, `shipping_rates`	zone (countries), name, price_cents, free_from_cents, is_active. Values from the client (section 13)
`order_events`	order_id, from_status, to_status, user_id, note, created_at
`price_history`	product_id, price_cents, valid_from, valid_to (6.1)
`credit_notes`	invoice_id, type (refund, cancellation), number (own sequence), refund_id, net, VAT and gross per rate, total_cents, pdf_path, issued_at
`refunds`	order_id, mollie_refund_id or manual reference, amount_cents, lines (JSON), includes_shipping, status (processing, refunded, failed), reason, created_by
`coupon_redemptions`	coupon_id, order_id, email, address_hash, created_at, released_at
`captures`	order_id, mollie_capture_id, amount_cents, status
`activity_log`	admin user, action, subject, changes, time
`orders`	id, number (yearly sequence, for example `HS-2026-0001`), source (shop, manual), status, payment_status, oversold, stock_booked_at, receipt_sent_at, collected_at, rejected_at, till_receipt_number, email, company, customer_uid, phone, billing and shipping address, customer_note, locale, shipping_method (post, pickup), shipping_rate_id, subtotal_cents, discount_cents, shipping_cents, tax lines (JSON, per rate), total_cents, coupon_code, terms_version_id, age_confirmed_at, terms_accepted_at, ip, user_agent, paid_at, shipped_at, tracking_number, cancelled_at, refunded_cents, notes, timestamps
`order_items`	order_id, product_id or bundle_id, name snapshot, unit_price_cents, qty_ordered, qty_shipped, qty_refunded, discount_share_cents, line_total_cents
`order_item_parts`	order_item_id, product_id, tax_rate snapshot, gross_cents, VAT_cents. One part for a product, one per VAT rate for a bundle (3.4)
`payments`	order_id, provider, provider_payment_id, method, status, amount_cents, raw (JSON), timestamps
`invoices`	order_id, number (own gapless sequence), net, VAT and gross per rate (JSON), shipping net and VAT, total_cents, lines snapshot (JSON), delivery_date, pdf_path, issued_at, cancelled_by_credit_note_id
`legal_documents`	type (agb, datenschutz, widerruf, versand, impressum), version, body*, pdf_path, valid_from. Orders store the AGB version they were placed under
`services`	id, name*, duration_min, price_cents, description*, sort, is_active. Seeded with Leonie's three (section 5)
`booking_requests`	service_id, preferred_days (JSON), preferred_time, first_name, last_name, email, phone, topic, message, health_consent_at, status (new, contacted, booked, closed), notes
`enquiries`	type (trade, contact), payload (JSON), consent_at, status
`posts`	slug, title*, excerpt*, body* (rich text), cover_image, author (one of the three), published_at, seo_title*, seo_description*
`settings`	key and value, for opening hours, café menu text, announcement bar, company data for the Impressum, order notification email, shipping note
`redirects`	from_path, to_path, code 301. Seeded with section 7.1

Table	Fields
`users`	admins only, with role. No customer accounts in phase 1

`*` translatable.

3.2 Admin (Filament), every back end feature

Users and roles.

- **Owner**, for the three partners. Everything in modules A to O below, except the parts marked Admin.
- **Admin**, for Astra. Everything, plus legal documents, redirects, tax rates, shipping zones, payment settings, users, homepage content and system settings.
- Two factor sign in for every admin user. Three named logins for the partners, no shared password.

How to read the tables. **P1** is phase 1, it's in the 500 euro scope if Raka keeps section 11 as it is. **P2** is later, priced separately. **Check** means Josh confirms a fact before building it. Everything marked P1 is the minimum a webshop selling food in Austria needs to run day to day. Nothing in P1 is optional.

A. Products and catalogue

Feature	What it does	Phase
Product list	Table with image, name, category, price, stock, status (live, draft, hidden). Search, filter by category and status, sort. Price and stock editable inline in the list	P1
Product edit	Tabs, Basics (names, texts, category, time slot, ribbon), Price (the tax rate is shown but only Admin can change it, as the accountant sets it), Stock, Food information (6.2), Images, Planner (key, portions, medication and pregnancy flags), SEO. German and English side by side	P1
Publish rules	A product can't go live without every required food field, a price, a tax rate, a net quantity and one image. The save button says which field is missing	P1
Draft and preview	Save as draft, preview the product page as a visitor sees it before going live	P1
Hide or archive	Take a product off the shop without deleting it. Old orders and invoices keep pointing at it. Products with orders can never be deleted	P1
Duplicate	Copy a product as a starting point for a new one	P1
Scheduled publish	A date and time a draft product goes live on its own	P1
Product import and export by CSV	Bulk changes in a spreadsheet	P2, seven products don't need it
Reviews, related products, wishlists	Not built	Out
Images	Several images per product, drag to reorder, alt text in both languages, automatic resize to WebP, max file size	P1
Categories	Create, rename, reorder. Used for the shop grouping, coupons and sales	P1
Ribbons	"Neu", "Best Seller" or free text per product, both languages	P1
Variants (sizes, flavours)	Not needed today, all 7 live products have no options in their Wix page data (read 27 Oct). Each new size is a separate product in phase 1	P2
Weight per product	Grams with packaging, used if shipping is priced by weight (6.4)	P1

B. Stock (inventory)

The café sells the same packaged range to take home (Heute, 16 Oct 2026, "Alle Produkte können im Café probiert, aber auch gleich mit nach Hause genommen werden."). So the online stock and the café shelf come out of the same production. Stock is one number per product, and every change to it is written down.

Feature	What it does	Phase
Stock per product	Current quantity, on or off (`track_stock`). Untracked products never sell out	P1
Stock ledger	Every change is a row in `stock_movements` (product, change, reason, order or user, note, time). The current stock is the sum, never edited directly. Gives a full history per product	P1
Reasons	Sold online (automatic), returned (automatic on a refund with return), production batch in, café sale or café shelf, damaged or expired, samples and giveaways, stock count correction. Reasons are a fixed list the Admin can extend	P1
Stock in	"Add production batch", quantity, batch or lot number, best before date, note	P1
Stock count	A stock take screen listing every product with the system quantity, type the counted quantity, the difference is booked as "stock count correction"	P1
Low stock threshold	Per product, with a store default. Email to office@ and a dashboard warning when stock drops below it	P1
Out of stock behaviour	At zero, the product shows "Ausverkauft" and can't be added to the cart. Store setting chooses between showing it sold out or hiding it. No backorders	P1
Household quantities	Their AGB sections 2 and 3 sell only "in Haushaltsmengen". A maximum quantity per product per order, store default 10, editable per product. The cart enforces it	P1
Bundles and stock	A bundle has no stock of its own. It's available while every product inside it is. Selling a bundle books each product out	P1
Taking stock	Stock is booked out when a payment is paid or authorized (4.2), with a row lock. Two orders for the last unit flag the second as `oversold`	P1
Returning stock	Booked back in automatically on reject, partial shipping, oversold and refunds before shipping. After shipping, the refund screen asks "goods back and sellable?", yes books it in, no books it as damaged. Full table in 3.4	P1
Batch and best before tracking	Which batch went into which order, first expiry first out. Useful for a food recall	P2
Café till sync	Café sales booked automatically from their till	P2, depends on which till they use
Stock export	CSV of products with quantity and stock value at cost (if they enter cost)	P1

C. Prices, sales, coupons and bundles

Feature	What it does	Phase
Price	Gross price per product (6.1). Every change writes `price_history`	P1
Cost price	Optional, admin only, for stock value and margin in reports	P1
Timed sale	Percent off for chosen products or categories between two dates, "15% off for Christmas". Starts and ends on its own. The struck through price is the lowest price of the 30 days **before the sale started** (6.1)	P1

Feature	What it does	Phase
Coupon codes	Percent or fixed amount, minimum order value, start and end, total uses, uses per customer, products or categories it applies to, can exclude sale items. AGB section 4 limits promo codes to once per customer, household or delivery address, so the check uses email and the delivery address	P1
Free shipping coupon	A coupon type that sets shipping to zero	P1
Bundles	Pick products and quantities, set the bundle price, start and end dates, image. The saving against the single prices is computed. Shown as "Sets" on `/shop`	P1
Discount order	Sale on the item first, then the coupon. One coupon per order (6.1)	P1
Gift cards	Sell and redeem vouchers	P2. Vouchers that work like money have their own tax rules, the accountant decides first
Customer price lists for trade	Special prices for shops and pharmacies	P2 (see G)

D. Cart and checkout settings

Feature	What it does	Phase
Guest checkout	No customer account needed. Accounts are P2	P1
Cart kept	Session cart kept for 14 days on the same device (setting)	P1
Countries	Only the countries the client ships to can be chosen (6.3, 6.4). Austria only at launch unless they say otherwise	P1
Minimum order value	Off by default, setting in euros	P1
Address checks	Required fields, Austrian postcode is 4 digits, phone optional (the prototype has it optional)	P1
Different delivery address	Tick box, second address block	P1
Company purchase	Optional company name and UID field on the billing address, shown on the invoice	P1
Order note	Free text from the customer, shown on the order	P1
Abandoned cart emails	Emails to people who left a cart	No. Needs marketing consent, and they don't want newsletters

E. Payments (Mollie)

Feature	What it does	Phase
Methods	Cards, Klarna, EPS, Apple Pay, switched on in the client's Mollie dashboard (4.2). The checkout lists the methods Mollie returns for the basket amount, so a method switched off in Mollie disappears from the shop on its own	P1
Status handling	Mollie's statuses (docs.mollie.com, "Handling payment status", read 28 Oct) are `open`, `pending`, `authorized`, `paid`, `canceled`, `expired`, `failed`, and Mollie calls the webhook for every one except `open`. Mapping below	P1
Capture	Klarna is authorized at checkout and captured when the order is marked shipped (4.2). If the capture fails, the order stays unshipped and the admin shows the error	P1

Feature	What it does	Phase
Refunds	Full or partial, by item or amount, from the order screen through the Mollie API, following the rules in 3.4. Shipping included by default on a full withdrawal. Credit note only once an invoice exists and the refund has reached `refunded`. The order shows refunded total and what's left	P1
Chargebacks	Mollie calls the webhook when "a chargeback is received on the payment" (docs.mollie.com/reference/webhooks, read 28 Oct). The handler sets `payment_status` to `charged_back`, flags the order and emails office@. A nightly check against the Mollie API catches any missed webhook	P1
Payment link for manual orders	Create a Mollie payment link for an order typed in by the owners (G), send it by email	P1
Pay later on invoice for trade customers	Ship first, the trade customer pays to their Erste Bank IBAN (Impressum) within agreed terms, with open item tracking and reminders	P2. In P1 a manual order can already be marked paid by bank transfer once the money is in (G)
Reconciliation	Mollie pays out in batches minus fees. Export (J) lists Mollie payment id and the order, so the accountant can match payouts. Mollie's own settlement reports come from their dashboard	P1
Test mode	Staging uses Mollie test keys, a banner on every staging page says "Testmodus"	P1

Mollie status to order status.

Mollie payment	Order
`open`, `pending`	status `pending_payment`, payment `unpaid`
`authorized`	status `awaiting_shipment`, payment `authorized` (Klarna). Stock booked out and receipt sent, once (3.4)
`paid`	before shipping, status `awaiting_shipment`, payment `paid`, stock and receipt once. After a Klarna capture, only `payment_status` changes, nothing else happens
`canceled`, `expired`, `failed`	before anything was booked, status `cancelled`, the customer can return to the cart. A `cancelled` after a Klarna release is the result of Reject, the order is already `rejected` and its stock already back

F. Orders

Feature	What it does	Phase
Order list	Number, date, customer, total, payment status, order status, working days open (4.4). Filters by status, date, payment method, product. Search by number, name, email	P1
Order detail	Items, prices, discounts, VAT per rate, shipping, addresses, customer note, payment with Mollie id, timeline from `order_events`, internal notes	P1
Actions	Mark as shipped (tracking number, captures Klarna, sends the shipping email and the invoice), Mark as collected, Ship partially, Reject and refund, Delay notice (4.4), Cancel before payment, Refund, Record manual refund, Send replacement, Returned undeliverable, Cancel invoice (Storno and corrected invoice), Edit address before shipping, Resend any customer email, Download invoice and credit notes	P1
Packing slip	PDF per order with items and quantities, no prices, delivery address. Bulk print for all orders ready to ship	P1
Address label	Printable delivery address for the parcel, A6 or A4 sheet	P1
Bulk actions	Select several orders, print packing slips, mark as shipped	P1

Feature	What it does	Phase
Order export	CSV of orders for any date range	P1
Returns	Customer withdraws in any form, letter, phone or email (AGB section 10). The owner records the withdrawal date on the order. The owner records the return on the order, refunds once the goods are back, rebooks stock if sellable	P1
Post shipping labels from the Post API	Labels and tracking created automatically	P2

G. Manual orders, phone, email and trade

Their AGB section 1 covers "telefonisch oder per E-Mail ausgelöste Fernabsatzbestellungen", and their LinkedIn page says they're building partnerships with retailers and pharmacies.

Feature	What it does	Phase
Create order in the admin	Pick products and quantities, customer and addresses, optional discount, shipping. The same prices, VAT and stock rules as the shop	P1
Payment for a manual order	Send a Mollie payment link by email (E), or mark as paid by bank transfer once it's in their account, with a note. **Cash is not taken through the website.** A cash payment in the café is a cash sale and goes through the café's till with its receipt (usp.gv.at, Registrierkassen). The order is then marked paid with the till receipt number	P1
Trade customers	A customer flagged as trade, with company name, UID and its own price list and payment terms	P2

H. Shipping and fulfilment

Feature	What it does	Phase
Shipping zones	Countries per zone, Austria first (6.4)	P1
Shipping rates	Per zone, flat price, or by weight bands, or by basket value bands, plus a free shipping threshold. The client's model decides which (6.4, section 13)	P1
Pick up at the Gut Health Club	Collect the order at Wildpretmarkt 1 for free, a "ready to collect" email when packed. The order is paid online beforehand. Handing it over is the moment of delivery, so the action is **Mark as collected**, which captures Klarna, issues the invoice and sends it, the same as Mark as shipped. **The client decides** if they want it (section 13)	P1 if they want it
Delivery time text	"Die Lieferung innerhalb Österreichs beträgt ab Versandzeitpunkt 1-3 Werktage." from their shipping page, editable	P1
Tracking link	The shipping email builds the Post tracking link from the tracking number	P1

I. Invoicing and credit notes

Feature	What it does	Phase
When an invoice is made	When the order is marked shipped, because their AGB section 3 forms the contract on shipping. The invoice goes with the shipping email. Invoice date and delivery date are the same day	P1
Numbering	Own gapless sequence per year, prefix from settings, for example `RE-2026-00001`. Made inside a database transaction so two invoices never share a number and none is skipped. Order numbers are a separate sequence	P1
Content	Seller name, address, UID ATU82537658, FN 661029 b. Customer name and address, company and UID if given. Invoice number and date, delivery date. Items with quantity, net price, VAT rate, VAT amount, gross. Discounts as their own lines. Shipping as its own line. Net and VAT per rate, gross total. Payment method and Mollie id. The accountant confirms the list against UStG section 11	P1

Feature	What it does	Phase
Small invoices	Austrian rules allow a simplified invoice up to 400 euros gross, but it still needs the note "Rechnungsdatum = Lieferdatum" (usp.gv.at, Kleinbetragsrechnungen, updated 1 Jan 2026). Our invoices carry the full set anyway, plus that note when the dates match	P1
Language	German, because their contract language is German (AGB section 3). An English line under the title is fine	P1
Immutable	An invoice is never edited or deleted. A mistake is fixed with the Cancel invoice action, a cancellation credit note plus a corrected invoice (3.4)	P1
Credit notes	For every refund made **after** an invoice exists, issued when the refund reaches `refunded`, plus cancellation credit notes for mistakes (3.4). Own gapless sequence, refers to the invoice number, negative amounts per VAT rate. A refund before shipping has no invoice and so no credit note	P1
PDF storage	Stored privately on the server and in the backups, downloadable from the order. Kept for the retention period the accountant gives (6.5)	P1
Template	Their logo, company data from settings, footer with bank details from settings	P1
Receipts for the café	The café's till handles café sales. Online shop sales don't need a cash register when payment is not cash, but they need a receipt or invoice (usp.gv.at, Registrierkassen, updated 1 Oct 2026). Our invoice is that	P1
E-invoicing for business customers	Structured e-invoices	P2, only if a trade customer asks

J. Export for the accountant

Feature	What it does	Phase
Monthly export	One click, choose a month, download a ZIP with every invoice and credit note PDF plus one CSV listing them	P1
CSV columns	Document type (invoice or credit note), number, date, delivery date, order number, customer name, country, UID if any, net, VAT and gross **per VAT rate**, shipping net and VAT, total gross, payment method, Mollie payment id, refers to (for credit notes). German number format option (comma decimals, semicolon separator)	P1
Format for their software	Austrian accountants mostly use BMD or RZL. There's no single public format for sales invoices into BMD. **Ask their accountant** which columns, account numbers and tax codes they want, and build the CSV to match. Test one month's file in their software before launch	P1, check
Payments export	CSV of payments and refunds per month with Mollie ids, for matching Mollie payouts	P1
VAT summary	Per month, net and VAT per rate, for the VAT return. A report, not a filing. **When VAT is due depends on their tax setup.** Austria taxes payments received before delivery in the month they're paid (Mindest-Istbesteuerung), and a small business on the Kleinunternehmer rule charges no VAT at all. The accountant says which applies, and the summary groups by payment date or invoice date to match	P1, check
Café till sales	Manual orders paid at the café till are listed in their own section of the export with the till receipt number and no invoice number, so they're never booked twice (3.4)	P1
Automatic monthly email	The export emailed to the accountant on the 3rd of each month	P2

K. Customers and privacy

Feature	What it does	Phase
Customer list	Built from orders by email, with order count, total spent, last order. No logins	P1

Feature	What it does	Phase
Customer detail	Their orders, addresses, notes, and a **blocked** flag. AGB section 7 lets them refuse delivery after repeated failed deliveries, a blocked email or address can't check out and sees a short message to contact office@	P1
Data access request	Export everything stored about one email as a file (GDPR article 15)	P1
Erasure request	Anonymise one email's personal data, except invoices and orders that must be kept by law, those stay and are marked as held for retention	P1
Automatic deletion	Booking requests and enquiries deleted after the period in settings (default 12 months after closing)	P1
Customer accounts	Log in, order history, saved addresses	P2

L. Emails

Feature	What it does	Phase
Templates	Every email in 3.3 has its subject and text editable in the admin, German and English, with placeholders (name, order number and so on). The layout uses their logo and colours	P1
Sender	From name "Healthy Secrets", from address on healthysecrets.at, reply to office@	P1
Copy to office@	Optional BCC of every customer email	P1
Email log	Every email sent, to whom, when, delivered or bounced (from the mail service)	P1

M. Bookings and enquiries

Section 5 for bookings, section 2.3 for the forms. Admin can change status, add notes, reply by email from their own mailbox, export CSV. Services editable (name, duration, price, text, on or off). P1.

N. Blog and content

Feature	What it does	Phase
Blog posts	Title, slug, excerpt, body with headings, images, links and lists, cover image, author, publish date (schedule ahead), both languages, SEO fields, draft and preview	P1
Categories for posts	Optional	P2
Opening hours	Per weekday, with closed days and holiday exceptions, shown on `/club` and in structured data	P1
Café menu	Text list with optional prices, both languages	P1
Announcement bar	One line at the top of every page with start and end dates, for example "Weihnachtsaktion bis 24.12."	P1
Legal documents	AGB, Datenschutz, Widerruf, Versand as versioned pages with PDF, Admin role only. The current AGB version is stored on every order	P1
Homepage and page texts	Changed by Astra under the care plan, as agreed on the call	Admin

O. Dashboard and reports

Feature	What it does	Phase
Dashboard	Today's and this month's sales, orders to ship with working day count, low stock, new bookings and enquiries, payments needing attention (failed captures, chargebacks)	P1
Sales report	By day, week, month, by product, by payment method, average order value, coupon use, margin where a cost price is set. Date range, CSV export	P1

Feature	What it does	Phase
Stock report	Current stock, stock value, movements per product over a date range	P1
Visitor analytics	Needs consent or a cookieless tool (6.5)	P2

P. Users, security and audit

Two factor sign in, roles as above, login rate limiting, every admin change written to `activity_log` with who and what changed, viewable by Admin. Password reset by email. Session timeout after inactivity. P1.

Q. System, jobs and maintenance (Admin only)

Scheduled jobs, each logged with its last run, visible to Admin.

Job	When
Start and end timed sales and bundles	Every minute
Expire unpaid orders Mollie reports as expired	On the webhook, plus a check every hour
Five working day warnings and Klarna capture warnings (4.4, 4.2)	Daily 07:00 Vienna
Read chargebacks from Mollie	Nightly
Low stock email	When it happens, plus a daily summary
Delete old booking requests and enquiries	Nightly
Regenerate `sitemap.xml`	On publish, plus nightly
Database backup off the server	Nightly, kept 30 days
Queue health, a job that hasn't run alerts Astra	Every 5 minutes

Also for Admin, maintenance mode with a message, clear caches, see failed queue jobs and retry them, see the email log.

3.2b Settings, every configurable value

Setting	Default	Who
Shop name, company name, address, UID, FN, email, phone, bank details	from their Impressum	Admin
Order number pattern	`HS-{YYYY}-{00001}`, counter starts at 1 each year in Vienna time	Admin
Invoice and credit note patterns	`RE-{YYYY}-{00001}` and `GS-{YYYY}-{00001}`, yearly counters, each gapless	Admin, the pattern locks once the first document of a year exists
Currency	EUR, prices include VAT	fixed
Tax rates and product tax class	from the accountant (6.3)	Admin
Shipping zones, rates, free threshold, delivery time text	from the client (6.4)	Admin
Pick up at the café on or off	off until the client decides	Owner
Countries allowed at checkout	Austria	Admin
Minimum order value	off	Owner
Max quantity per product per order	10	Owner
Low stock default threshold	5	Owner
Show sold out products or hide them	show as sold out	Owner

Setting	Default	Who
Cart lifetime	14 days	Admin
Notification email for orders, bookings, enquiries	office@healthysecrets.at	Owner
BCC customer emails to office@	off	Owner
Email sender name and address	Healthy Secrets, address on healthysecrets.at	Admin
Opening hours, café menu, announcement bar	empty until the client sends them	Owner
Retention for bookings and enquiries	12 months after closing	Admin
Mollie API keys, mail service keys	in `.env`, never in the database or the admin	Admin, on the server
Maintenance mode	off	Admin

3.3 Emails (queued, German or English by the order's locale)

Trigger	To	Content
Order paid (or Klarna authorized)	customer	**Order receipt, not acceptance.** Their AGB section 3 says the contract only forms when the goods ship. Wording comes from the client. Includes the order, prices, VAT, shipping, address. **The AGB and the withdrawal information and form go as PDF attachments**, not links. The Austrian distance selling law (FAGG section 7) wants them on a durable medium, Nikolaus confirms
Order paid (or Klarna authorized)	office@	New order alert with a link to the admin
Marked as shipped	customer	Shipping confirmation, tracking number, any reduced quantities. This is the acceptance under their AGB. Invoice PDF attached
Rejected, or delayed by stock	customer	From the admin actions in 4.4
Manual order created (3.2 G)	customer	Order details and the Mollie payment link
Ready to collect (if café pick up is on)	customer	Address, opening hours
Chargeback or failed capture	office@	Which order and what to do
Payment failed or expired	customer	Short note with a link back to the cart
Refund reached `refunded`	customer	Amount, method, credit note attached if one exists
Order collected at the café	customer	Invoice attached
Withdrawal received	customer	Confirmation of receipt, with date
Stock below a threshold	office@	Low stock alert
Booking request	office@ and the customer	Request received, Leonie confirms by email or phone

Trigger	To	Content
Trade or contact enquiry	office@ and the sender	Received

Sending goes through a transactional email service, not their Google mailbox (section 9 covers the DNS records).

3.4 Money, stock and documents. The exact rules for every order event

This is the part where webshops go wrong, so it's written as rules, not features. Every rule here was checked against Mollie's docs on 28 Oct (docs.mollie.com, "Handling payment status", "Place a hold for a payment", "Webhooks", "Klarna") and their AGB.

Two statuses per order, not one. `orders.status` is the work (`pending_payment`, `awaiting_shipment`, `shipped`, `collected`, `completed`, `rejected`, `cancelled`). `orders.payment_status` is the money (`unpaid`, `authorized`, `paid`, `partially_refunded`, `refunded`, `charged_back`). Plus the flag `oversold`, and timestamps `stock_booked_at`, `receipt_sent_at`, `shipped_at`, `collected_at`, `rejected_at`, `cancelled_at`.

Do it once. Mollie calls the webhook again for every later change (capture, refund, chargeback). So stock is booked only when `stock_booked_at` is empty, and the receipt only goes out when `receipt_sent_at` is empty. The webhook handler never moves an order backwards.

Cards, EPS, Apple Pay. Charged at checkout (automatic capture). Paid means `paid` at once.

Klarna. Created with `captureMode: manual`. Without it Mollie captures straight away. Mollie's hold page says a Klarna authorization expires after **28 days**, so the dashboard warns at day 21. At checkout the payment is `authorized`. On Mark as shipped or Mark as collected, create a capture for the shipped amount with its lines. If not everything ships, release the rest of the authorization. When nothing is left authorized, Mollie sets the payment to `paid` and calls the webhook, which only updates `payment_status`. Card holds are shorter (Visa and American Express 7 days, Mastercard 30 days per the same page), so cards stay on automatic capture.

Event	Money	Stock	Document	Email to customer
Paid (card, EPS, Apple Pay)	captured	booked out once	none yet	receipt (3.3)
Authorized (Klarna)	held	booked out once	none yet	receipt
Payment canceled, expired or failed before anything was booked	none	nothing	none	payment failed note
Mark as shipped or collected, everything	Klarna captured	already out	**invoice** for the shipped lines	shipping or collected email with invoice
Ship partially	cards and EPS refund the unshipped part, Klarna captures the shipped part and releases the rest	unshipped quantity booked back in	invoice for the shipped lines only	shipping email listing what was reduced
Reject before shipping	cards refunded in full, Klarna released (payment becomes `canceled`)	booked back in	none, there's no invoice yet	rejection email

Event	Money	Stock	Document	Email to customer
Refund before shipping (customer changed their mind, oversold)	refunded	booked back in	none	refund email
Withdrawal after shipping (AGB section 10)	refunded when the goods are back, including the original shipping on a full withdrawal, never the return postage	back in if sellable, else "damaged"	**credit note**	refund email
Refund after shipping for a complaint, goods kept	refunded	nothing	credit note	refund email
Replacement for damaged or missing goods (AGB sections 7 and 11)	none	booked out, reason "replacement"	none, it's free	shipping email
Parcel returned undeliverable (AGB section 7)	the owner decides, reship or refund	back in if sellable	credit note if refunded	from the action taken
Chargeback	taken back by the bank	nothing automatic	credit note once the owner confirms it	none, office@ is alerted
Mistake on an invoice	none	nothing	**cancellation credit note** (Storno) for the whole invoice, then a corrected invoice	corrected invoice

Refunds are asynchronous. A Mollie refund goes `processing`, then `refunded` or `failed`, and the webhook fires for each (Mollie "Webhooks" page). Keep a `refunds` table. The credit note is issued when the refund reaches `refunded`, never when it's created. A failed refund alerts office@ and creates no document.

Refunds by line. `order_items` stores `qty_ordered`, `qty_shipped`, `qty_refunded` and `discount_share_cents` (its part of any coupon). A line can't be refunded beyond what was paid for it. Refunding one item gives back its price minus its discount share.

Coupons on a partial withdrawal. AGB section 4 says the coupon's minimum order value must still be reached after a partial withdrawal, or the coupon's value is owed. When a refund would drop the order below the coupon minimum, the refund screen shows the difference and the owner decides whether to deduct it.

Coupon uses are counted in a `coupon_redemptions` table when the payment is paid or authorized, and given back when the order is cancelled or rejected before shipping.

Bundles and VAT lines. A bundle is stored as one cart line for the customer, but on the order, the invoice and the Mollie `lines` it's split into one part per VAT rate (6.3). Mollie checks each line's `vatAmount` against its total and rate, so each part carries its own `vatRate`. Same for a fixed coupon, one discount line per VAT rate.

Manual orders paid by bank transfer. Refunds can't go through Mollie, so the refund screen offers "record a manual refund" (date, amount, bank reference), which creates the credit note.

Café till payments. If a manual order is paid in cash at the café, the till receipt is the document for that sale. The website issues **no invoice** for it, stores the till receipt number, and lists it separately in the export (J) so it's never counted twice. Stock comes off through the order, not again as "café sale". The accountant confirms this.

Changing an order after payment (adding or swapping items) is not built in phase 1. The owner refunds what's dropped or cancels and makes a new order.

Time zone. The app runs on `Europe/Vienna`. Dates on documents, the yearly number reset, monthly exports and the working day count all use Vienna time.

Public holidays for the five working day count are computed, not typed in, including the ones that move with Easter (Easter Monday, Ascension, Whit Monday, Corpus Christi). Josh uses a maintained package or a tested function.

---

4. Checkout and payments

4.1 The flow their AGB fixes (AGB Nov 2025, section 3, read 27 Oct)

Their AGB describe the steps and we have to match them. "Artikel in den Warenkorb legen → zur Kasse → Eingabe/Rechnung/Versand/Bezahlart prüfen → Zusammenfassung", with corrections possible before ordering.

1. Cart.
2. Address (billing, optional different shipping address), email, phone.
3. Shipping method and payment method.
4. **Summary page.** Every item, quantities, unit prices, discounts, shipping, total, VAT per rate, the delivery address, and edit links back to each step.
5. Two required checkboxes. "Ich bin mindestens 18 Jahre alt." (AGB section 3 sells only to people over 18, wording from the prototype). And the AGB box. AGB section 3 calls it „Akzeptieren der Allgemeinen Geschäftsbedingungen“ and ties the "read section 12" confirmation to the "Zahlungspflichtig bestellen" button, while the prototype puts it in the checkbox, "Ich habe die AGB gelesen, auch die Informationen zu Gesundheit und Ernährung in Abschnitt 12." Nikolaus picks the final wording. Store both timestamps on the order. Phone stays optional, as in the prototype.
6. The final button reads exactly **"Zahlungspflichtig bestellen"** (AGB section 3 names it, and the prototype already uses it). The prototype's English label is "Place order and pay", keep it.
7. Create the order (status `pending_payment`), create the Mollie payment, redirect to Mollie.
8. Return URL shows "we're checking your payment" until the webhook confirms, then the thank you page.

4.2 Mollie

- One Mollie account in the client's name (KYC with their company documents). Astra never holds their money.
- Use the Payments API with Mollie's hosted checkout (redirect). Methods to switch on, after the client's account shows them as available, cards, Klarna, EPS, Apple Pay. With the hosted checkout Apple Pay runs on Mollie's page, so no domain verification is needed on ours. Their AGB section 5 names cards and Klarna today.
- **The webhook is the only source of truth.** On each call, fetch the payment from the Mollie API by id (the webhook body only carries the id), then update the order. Handle repeat calls without side effects (idempotent). Never mark an order paid from the return URL.
- **Klarna works differently.** Mollie's Klarna page (docs.mollie.com/docs/klarna, read 27 Oct) requires `lines` and the billing fields (given name, family name, street and number, postal code, city, country, email), and advises to authorise first and capture when the goods ship. Create Klarna payments with `captureMode: manual`, capture on shipping, release what isn't shipped, warn at day 21 of the 28 day hold. Full rules in 3.4. That matches AGB section 3, where the contract forms when the goods ship.
- Send `lines` for every method, not only Klarna, so every payment shows its items in Mollie.

- On paid or authorized, decrement stock in a database transaction with a row lock (`SELECT ... FOR UPDATE`). If two people pay for the last unit, the second order is flagged `oversold` in the admin and the office alert says so. The owner ships a smaller quantity or rejects and refunds (4.4). Nothing is reserved while the customer is at Mollie, stock is that small and that rare to run out.
- Send the receipt and the office alert.
- Refunds through the API from the order screen, recorded in `payments` and on the order.
- Expired or failed payments release nothing (stock is only taken on paid or authorized) and the order goes to `cancelled` after Mollie's expiry.
- Test mode keys on staging, live keys only on production, both in `.env`, never in git.

Fees from Mollie's own pricing page, read 27 Oct 2026, for the proposal's running costs. EEA consumer cards 1.80% plus 0.25 €. Commercial cards 2.90% plus 0.25 €. American Express 2.90% plus 0.25 €. Klarna (DE, AT, CH) 2.99% plus 0.35 €. EPS 1.50% plus 0.25 €. Apple Pay at the rate of the card used. No monthly fee for online payments.

Their AGB section 5 names "WIXPayment" and Klarna. It has to be updated to Mollie before launch. That's their text, Nikolaus is a lawyer, he writes it.

4.3 Order statuses

Two fields, as set out in 3.4. `status` runs `pending_payment` → `awaiting_shipment` → `shipped` or `collected` → `completed` (14 days after delivery), with side paths `rejected` and `cancelled`. `payment_status` runs `unpaid` → `authorized` or `paid` → `partially_refunded`, `refunded` or `charged_back`. `oversold` is a flag. Every status change is written to an `order_events` table (order, from, to, user, note, time).

4.4 What their AGB promises after the order

- **Five working days.** AGB section 3 says the contract forms when the goods ship within 5 working days (Monday to Friday, not public holidays) of the order receipt, and if stock is short the customer gets an email within those 5 days. The admin shows each open order's working day count, and the dashboard warns at day 3. Austrian public holidays are computed, including the ones tied to Easter (3.4).
- **Reject.** AGB section 3 allows refusing an order without reasons. Admin action **Reject and refund**, full refund or Klarna release, email to the customer.
- **Smaller quantity.** AGB section 2 allows shipping less when demand beats stock, the customer is told in the shipping confirmation. Admin action **Ship partially**, set the quantity per line, refund or release the difference as in 3.4, book the rest back into stock, and the shipping email lists what was reduced.
- **Shortage notice.** Admin action **Delay notice**, a short email that the goods are delayed by stock.

---

5. Leonie's booking

Services, seeded from https://www.healthysecrets.at/services-2 (read 19 Oct, the page title is "Termin buchen" and no link on their site points to it).

Service	Duration	Price
Ernährungstherapie	60 min	120 €
BIA Messung	30 min	50 €
Ernährungstherapie & BIA Messung	120 min	160 €

Phase 1 is a **booking request**, exactly as the prototype shows. The visitor picks a service, preferred weekdays and a time of day, leaves details, ticks the consent box and sends. Leonie gets an email and

the request in the admin, she confirms the time herself. No calendar sync, no online payment.

The form asks about health ("anliegen", "nachricht"). That's health data under GDPR article 9, so the explicit consent checkbox stays required, its timestamp is stored, the text links the privacy policy, and requests are deleted on a schedule the client sets (default 12 months after closing).

Phase 2 option, real time slots from Leonie's calendar and paying online. Not promised.

---

6. Rules that change the code

6.1 Prices

- Shop prices are gross, with VAT included, and the product page says so ("inkl. MwSt."). The live Wix pages show prices with tax included (`taxOnProduct: true` in their page data, read 27 Oct). **Their AGB section 4 says consumer prices are exclusive of VAT.** That sentence contradicts the shop and Austrian practice for consumers. Flag it to Nikolaus, he fixes the AGB. Build gross.
- Show a unit price per kg or litre next to each price (computed from `net_quantity`). Nikolaus confirms whether it's required for them. It costs nothing to show.
- A struck through old price follows the Austrian price rule for reductions (PrAG section 9a, from the EU Omnibus directive). The reference price is the lowest price charged in the 30 days **before the reduction started**, and it stays the same for later steps of the same reduction (WKO FAQ on section 9a, and Verwaltungsgericht Wien 021-031-4195-2026). So `price_history` records every price the product was actually sold at, base prices and sale prices, and the reference is computed from the 30 days before the sale's start date. Section 9a has a special rule for goods that spoil quickly, Nikolaus says whether it applies to them.
- Discounts apply in a fixed order. Timed sale on the item first, then the coupon on the discounted basket. A coupon never stacks with another coupon. Sales and coupons can be set to exclude each other per coupon.

6.2 Food information on every product page, before the customer buys

EU Regulation 1169/2011 (LMIV) article 14 makes the mandatory food information available before the purchase in online selling, except the best before date. Their own AGB section 2 promises it too, "Zutatenverzeichnis, Allergene, Nettofüllmenge, alkoholhaltige Zutaten, Aufbewahrungshinweise, Name/Anschrift des Lebensmittelunternehmers".

So every product page shows, and the admin requires before a product can go live,

- name of the food,
- ingredients list with allergens highlighted (bold),
- "may contain" notes,
- net quantity,
- storage conditions and instructions for use,
- name and address of the food business operator,
- the nutrition declaration per 100 g (energy, fat, saturates, carbohydrate, sugars, protein, salt). Fibre too, because "Fibre Flow" and the copy about soluble fibre count as a nutrition claim and a claim makes fibre mandatory in the table (Regulation 1924/2006 article 7). Nikolaus confirms,
- the percentage of any ingredient named in the product name or stressed in the text (for example matcha in Matcha Latte, berries in Red Berry Mix), which the regulation calls the quantitative ingredient declaration,
- warnings (caffeine, St John's wort, the AGB section 12 notes).

The nutrition tables don't exist on their current product pages (handover point 4, 19 Oct). The client has to send them per product. This is the biggest content blocker.

Health claims. The prototype copy deliberately leaves out claims that aren't on the EU register (handover point 4). The client owns every claim on the site. Seed the products with the prototype's text, not the Wix text, and let Nikolaus add back what he signs off.

6.3 VAT

- Austria has four rates, 20%, 13%, 10% and, since 1 July 2026, 4.9% for selected staple foods listed in Anlage 3 to the UStG (usp.gv.at, last updated 10 Jul 2026). Most food stays at 10%. **Which rate each of their seven products takes is for their accountant**, so the rate is a field per product, never hard coded.
- The same page says the reduced 4.9% rate is lost when a qualifying food is delivered together with a non qualifying one. If any product turns out to be at 4.9%, the accountant has to say how bundles and mixed baskets are taxed before bundles go live.
- Invoices show net, VAT per rate and gross. Shipping VAT follows the rule the accountant gives.
- Rounding. Prices are gross per item. Work out VAT per line from the gross line total, round each line to the cent, and add the lines up per rate. The invoice total always equals the amount Mollie charged.
- A fixed amount coupon is split across the VAT rates in proportion to each rate's share of the basket gross. A percent coupon applies per line.
- Bundles don't carry one VAT rate. A bundle's price is split across its products in proportion to their single prices, and each part keeps its product's rate. Drop `tax_rate_id` from `bundles`.
- Invoice contents follow the Austrian VAT act (UStG section 11), the accountant confirms the list. Seller name, address and UID, customer name and address, a unique gapless number, issue date, delivery date, items and quantities, net amount and VAT per rate, the rate, gross total. Invoices under 400 € may be simplified, show the full set anyway.
- A refund after invoicing issues a credit note (Gutschrift) with its own number that refers to the invoice, and a mistake is fixed with a cancellation credit note (Storno), as set out in 3.4. Invoices are never edited or deleted.
- Sales to other EU countries. Under the EU rules, B2C sales to other EU states switch to the destination country's VAT (through OSS) once cross border sales pass 10,000 € a year. The accountant confirms how this applies to them. **Launch shipping to Austria only** unless the accountant says otherwise. The prototype offers AT, DE, IT and other EU, so trim that list to what they confirm.

6.4 Shipping

Two sources disagree. Every live product page shows "inkl. Versand" under the price (Wix shipping disclaimer, read 27 Oct). Their AGB section 4 and 7 say shipping costs are charged separately and shown before the order. The client decides which one is true. The data model supports both, a rate per zone with an optional free shipping threshold, or a rate of zero.

Carrier is Österreichische Post (their shipping page). Delivery in Austria 1 to 3 working days from dispatch (same page). No carrier API in phase 1, the tracking number is typed in when marking an order shipped.

6.5 Privacy

- Only strictly necessary cookies (session, CSRF, cart). No analytics, no pixels, no embedded Google Maps, no Instagram embed, so no consent banner is needed. If the client later wants analytics, add a consent banner first, or use a cookieless tool. The Gut Health Club map is the static SVG plus a link out to Google Maps, as in the prototype.
- Fonts stay self hosted (Jost files are in `site/assets/fonts`). Never load Google Fonts from Google.
- Booking health data consent, section 5.

- Events list, if kept, needs double opt in with the confirmation stored, and an unsubscribe link in every email.
- Their privacy policy (Nov 2025 PDF) must name the new processors before launch, the hosting provider, Mollie, the email service. That's their text. Josh sends Nikolaus the list of processors with their addresses.
- Data retention. Orders and invoices are business records and Austrian rules require keeping them for years (the accountant confirms the period, commonly 7). Don't build an automatic order deletion. Booking requests and enquiries get a deletion schedule.

6.6 Legal pages

Five PDFs are live on their site today (read 27 Oct).

File on healthysecrets.at	What it is	Where it's linked
`/_files/ugd/aadec6_21d69f4689574c8d8bbbda35919084d6.pdf`	AGB Healthy Secrets OG, Stand November 2025	AGB page, Impressum
`/_files/ugd/aadec6_8088b901b25d40f19378549a0a58b8ca.pdf`	Datenschutzerklärung Website, Stand November 2025	Impressum
`/_files/ugd/aadec6_7abc580e505b43f48cff26868e699818.pdf`	AGB of the old Healthy Secrets e.U., Stand April 2021	AGB page, Impressum, all 7 product pages, shipping page
`/_files/ugd/aadec6_43f30f6bad8b4314ab5e85f7454fcfb3.pdf`	Datenschutzerklärung Webshop of the old e.U., Stand April 2021	same places as above
`/_files/ugd/aadec6_7a8052ffb49c47aa9e9e89da4e660539.pdf`	Widerrufsformular, old address, a Gmail address and phone +43 676 625 653 8	same places as above

So the live shop links the 2021 e.U. terms from every product page. The new site links only current documents. The client has to supply a current Widerrufsformular (the 2021 one names healthysecrets.kundenservice@gmail.com and a different phone number from the AGB, which says 0043 676 777 10 15).

Their AGB section 14 links the EU online dispute resolution platform. That platform closed on 20 July 2025 when Regulation (EU) 2024/3228 repealed Regulation 524/2013 (CMS law update for Austria, iubenda, others). Tell Nikolaus, it's his text. Don't put an ODR link on the new site.

Accessibility. Build to WCAG 2.1 AA, the prototype already passes axe on all 9 pages. Whether the Austrian accessibility law applies to a micro enterprise like theirs is for Nikolaus.

---

7. Search and the move from Wix

7.1 Redirects (301), every URL in their two sitemaps today

Read from `pages-sitemap.xml` (15 URLs) and `store-products-sitemap.xml` (7 URLs) on 27 Oct. **Watch the trap, `/shop` on Wix is the tea category, not the shop.** Titles were checked page by page.

Old path	Old page title	New path
`/`	Healthy Secrets, Lebensmittel	`/`
`/shop-4`	Shop	`/shop`
`/shop`	Teemischungen	`/shop` (or a category URL if Josh builds them). The teas sit at two hours, Slimming Sips 19 Uhr, Lullaby Leaves 22 Uhr, so no single hour anchor fits

Old path	Old page title	New path
`/shop-2`	Fibre Flow Drinks	`/shop` (or a category URL). Matcha and Chai are at 15 Uhr, Moon Milk at 22 Uhr
`/shop-3`	Backmischung	`/shop/haferbrot-backmischung`
`/granola`	Granola	`/shop/omega-3-muesli-red-berry-mix`
`/kombucha`	Kombucha (empty category)	`/club` (kombucha is only sold in the café)
`/shop-1`	Merch (empty, "Coming Soon")	`/shop`
`/über-uns` (encoded `/%C3%BCber-uns`)	Über uns	`/ueber-uns`
`/general-9`	About	`/en/ueber-uns`
`/services-2`	Termin buchen	`/beratung`
`/faq`	FAQ	`/shop#faq`. The prototype's shop FAQ block has `class="faq"` but no id, add `id="faq"` in the port
`/shipping-returns`	Shipping and Returns	`/versand`
`/agb-1`	AGB	`/agb`
`/impressum`	Impressum	`/impressum`
`/product-page/shaping-secret`	Matcha Latte Fibre Flow	`/shop/matcha-latte-fibre-flow`
`/product-page/chai-latte-fibre-flow`	Chai Latte Fibre Flow	`/shop/chai-latte-fibre-flow`
`/product-page/moon-milk-fibre-flow`	Moon Milk Fibre Flow	`/shop/moon-milk-fibre-flow`
`/product-page/omega-3-müsli-red-berry-mix-300g` (encoded `m%C3%BCsli`)	Omega-3 Müsli Red Berry Mix 300g	`/shop/omega-3-muesli-red-berry-mix`
`/product-page/haferbrot-backmischung-500g`	Haferbrot Backmischung 500g	`/shop/haferbrot-backmischung`
`/product-page/slimming-secret-tea`	Slimming Sips 50g	`/shop/slimming-sips`
`/product-page/calming-secret-tea`	Lullaby Leaves 50g	`/shop/lullaby-leaves`
the five `/_files/ugd/...pdf` above	legal PDFs	2025 AGB to `/agb`, 2025 privacy to `/datenschutz`, the three 2021 files to the current page of the same type

Rows where the old and new path are the same (`/`, `/impressum`, and `/shop`, see below) are **not** redirects. Don't seed them into the `redirects` table or they loop. They just have to answer 200 on the new site. Note `/shop` changes meaning, Wix's `/shop` is the tea category and the new `/shop` is the whole shop, so it needs no redirect either.

New slugs are suggestions, Josh can change them before launch. Match both the raw and the percent encoded form of the two umlaut paths. Test every row with curl after the switch, expect one 301 then a 200.

7.2 On page

- Title and description per page and per product, editable, both languages.
- `sitemap.xml` with both languages and `hreflang` alternates, `robots.txt` pointing at it.

- Structured data. `Product` with `Offer` (price, currency, availability) on product pages. `Organization` site wide. `CafeOrCoffeeShop` on `/club` with the address Wildpretmarkt 1, 1010 Wien and the opening hours from settings. `BlogPosting` on articles.
- Open Graph image and text per page.
- Their domain already has a Google Search Console verification record (TXT `google-site-verification=Ul0q...`, section 9). Keep it, then submit the new sitemap in Search Console after launch and watch coverage for two weeks.

---

8. Hosting

Recommended. Laravel Forge managing one Hetzner Cloud server in the EU (Germany or Finland). If no Hetzner plan can be ordered on the day (both plan pages showed "unavailable" text on 27 Oct), use Laravel VPS from inside Forge or another EU host Josh trusts, and tell Raka the monthly price before ordering.

Item	What	Price, read 27 Oct 2026
Server	One Hetzner Cloud server in eu-central (Falkenstein, Nuremberg or Helsinki), at least 2 GB RAM. 1 GB is tight for PHP, MySQL and a queue worker	Listed 27 Oct, excl. VAT. CX23, 2 vCPU, 4 GB, 40 GB, 5.99 € a month (hetzner.com/cloud/cost-optimized, marked "not available"). CPX12, 1 vCPU, 2 GB, 40 GB, 11.99 € a month (hetzner.com/cloud/regular-performance, also showing "currently unavailable"). Availability changes, so pick the cheapest EU plan with 2 GB or more that can actually be ordered on the day
Backups	Hetzner's server backup option plus a nightly database dump to separate storage	check the backup add on price when ordering
Server management	Laravel Forge	Hobby 12 $ a month allows **one** external server (a Hetzner server counts as external). Growth 19 $ a month allows unlimited servers (laravel.com/forge/pricing). Hobby works if every Astra client shares one server, Growth if each client gets its own
Email sending	A transactional service with EU sending, Josh's choice (Postmark, Brevo or Mailgun EU are common)	price at signup, small at their volume. Name it to Raka so the privacy policy can list it
SSL	Let's Encrypt through Forge	free
Domain	stays where it is registered today	unchanged

Set up.

1. **Two sites on the server.** `staging` on a Forge hosted test domain or a subdomain, behind HTTP basic auth, with `noindex` headers, Mollie test keys and mail caught (no real customer emails). **Exempt the Mollie webhook route from basic auth on staging**, or test payments never complete. `production` on www.healthysecrets.at.
2. **Git deploy** from an Astra repository, zero downtime deploys (Forge includes them), `php artisan migrate --force` in the deploy script.
3. **Queue worker** as a Forge daemon. **Scheduler** cron every minute.
4. **Backups** tested by one real restore onto staging before launch.
5. **Monitoring.** Forge server monitoring plus an uptime check on `/` and on the Mollie webhook route. Error logging to a service Josh likes, set to email Astra.
6. PHP 8.4, OPcache on, `APP_DEBUG=false` on production.

Running cost at launch is the server (6 to 12 € a month plus VAT at the prices listed today) plus the email service, plus Forge on Astra's account (12 or 19 $ a month, shared across clients). **Raka decides whether the 50 € a month care fee includes hosting** (section 12).

---

9. Domain, DNS and their email. Don't break office@

What their DNS returns today (Google public DNS, 27 Oct 2026).

Record	Value
Nameservers	`ns10.wixdns.net`, `ns11.wixdns.net` (DNS is hosted by Wix)
`healthysecrets.at` A	`185.230.63.186`, `185.230.63.171`, `185.230.63.107` (Wix)
`www`	CNAME to `cdn3.wixdns.net` (Wix)
MX	Google Workspace, `aspmx.l.google.com` (10), `alt1` (20), `alt2` (30), `alt3` (40), `alt4` (50)
TXT	`v=spf1 include:_spf.google.com ~all` and `google-site-verification=Ul0qsJP6yPyPK5I5jgQtfc5XSPSc-FtKe6nhSEPSstc`
`mail.healthysecrets.at` A	`81.19.154.99`, reverse name `mwl01.world4you.com`, an Austrian host. Ask what it's for
DMARC	none
Google DKIM (`google._domainkey`)	none found

Their email runs on Google Workspace and their DNS sits at Wix. If DNS moves without copying MX and TXT exactly, office@ stops receiving mail, and that's where orders, bookings and Leonie's invite answers arrive.

We can only see the records we query by name. Wix's DNS panel may hold more. The registrar isn't confirmed (the nic.at lookup was blocked from here). The `mail` record pointing at World4You suggests the domain may have been registered there.

Cutover, in this order.

1. Get from the client the login of whoever holds the domain, and an **export or screenshot of every DNS record** in the Wix panel.
2. Choose where DNS will live after Wix, the registrar's own DNS or a DNS host like Cloudflare. Recreate every record there first, MX, SPF, the Google verification TXT, the `mail` record and anything else in the export. Compare record by record.
3. Add the email service's records. Its SPF include goes into the **same** SPF record (one SPF record per domain, for example `v=spf1 include:_spf.google.com include:<provider> ~all`), plus its DKIM records. Add a DMARC record starting at `p=none` with a report address. Ask the client's Google admin to switch on Google's DKIM in Workspace.
4. Lower the TTL on the old A and `www` records a day before.
5. On launch day, switch the nameservers (or the A and `www` records), issue SSL in Forge, run the redirect test (7.1) and send a test email to and from office@.
6. Keep the Wix plan running for 30 days after launch. Before cancelling, **export all Wix orders and customers to CSV** for their records, the accountant needs order history kept.
7. Switch off the Wix payments and Klarna connections only after the last Wix order is settled.

---

10. Security

- Admin on a non obvious path with 2FA and rate limited login. Every admin action logged.
- Mollie keys, mail keys and the app key in `.env` only. The repo has a `.env.example` without secrets.
- Webhook route excluded from CSRF, protected by fetching the payment from Mollie by id, never by trusting the body.
- Prices, discounts, stock and totals computed on the server only.
- Uploaded images validated by type and size, stored outside the web root or on the public disk with random names.
- `composer audit` and `npm audit` in the deploy script, monthly updates under the care plan.
- Personal data export and deletion for a customer (GDPR access and erasure requests) as an admin action, keeping invoices that must be retained.

---

11. Phases, to protect the budget

Phase 1, keeps every promise from the call	**Phase 2, priced separately**
All 9 prototype pages in Laravel, DE and EN on their own URLs	Customer accounts and order history
Product pages with full food information	Real time booking slots and online payment for Leonie
Cart, checkout as in section 4, Mollie with cards, Klarna, EPS and Apple Pay	Events list with double opt in
Admin modules A to Q marked P1 in 3.2, products, stock ledger and stock count, sales, coupons, bundles, orders with packing slips, manual orders with payment links, refunds and credit notes, invoices, the accountant export, customers and privacy requests, reports	Carrier API labels with Post
Every email in 3.3 with editable templates	Instagram feed, analytics with consent
Booking request for Leonie's three services	Shipping outside Austria with OSS VAT, gift cards, customer price lists for trade, batch tracking per order, café till sync, automatic monthly export email
Blog, Leonie writes in the admin	Nikolaus's own website (he asked about a bundle price on the call)
Trade enquiry form and the contact form	
Redirect map, sitemap, hreflang, structured data	
Hosting, DNS cutover, SSL, backups, monitoring	

Raka said "around two weeks" on the call. Phase 1 in two weeks needs every client input from section 13 on day one.

---

12. Decisions for Raka, before the proposal

1. **Scope at 500 euros.** Is it phase 1 above, a smaller cut, or a higher price for phase 1? The proposal must say exactly what's in.
2. **Who pays hosting.** Inside the 50 € a month, or passed through on top.
3. **Whose accounts.** Mollie must be the client's. Recommend the Hetzner server and the email service are in Astra's name and billed through the care fee, and the domain stays in the client's name.
4. **Blog in phase 1 or 2.** Leonie asked for it on the call, the email you sent says "Leonie can write her blog". This spec keeps it in phase 1.

5. **The events sign up.** Out of phase 1 in this spec. Keep it out, or build it with double opt in in phase 2.
6. **Forge plan.** Hobby (12 $) if all Astra clients share one server, Growth (19 $) if each client gets its own.

13. What we need from the client before Josh starts

#	Input	Why	Who
1	Nutrition table, full ingredients with allergens, storage and net quantity for all 7 products	Law (6.2), and the AGB promises it	Stephanie or Leonie
2	VAT rate per product, and how shipping and bundles are taxed	6.3	their accountant
3	Shipping model and prices, and which countries they ship to	6.4, the live site and the AGB disagree	Nikolaus
4	Updated AGB (payment section names Mollie, consumer prices gross, no ODR link), privacy policy naming the new processors, a current Widerrufsformular	4.2, 6.1, 6.5, 6.6	Nikolaus
5	Mollie account opened in their name, Astra added as a developer	4.2	Nikolaus
6	Domain registrar login and a full DNS export from Wix	9	whoever holds it
7	Google Workspace admin to switch on DKIM	9	whoever runs Workspace
8	Café opening hours and days, café menu with prices if they want them shown	`/club`, structured data	Leonie
9	Which email gets order, booking and enquiry alerts (office@ by default)	3.3	any
10	Stock counts per product, and SKUs if they use them	3.1	any
11	The 11 open content points in `handover.md` (Matcha at 44 € against 25 € for the other two drinks, claims to restore, portraits, kitchen photos and so on)	content	the three
12	Names for three admin logins	3.2	the three
13	The CSV layout their accountant wants (BMD, RZL or other), account numbers and tax codes, and the retention period	3.2 J, 6.5	their accountant
14	Do they want pick up at the Gut Health Club	3.2 H	the three
15	How café sales of the packaged range are booked against stock, by hand per day or not at all	3.2 B	Leonie
16	Weight of each product with packaging, if shipping is priced by weight	3.2 H	any
17	Invoice footer details and the first invoice number, if they want to continue Wix's numbering	3.2 I	their accountant
18	Their VAT setup. Kleinunternehmer or not (they have UID ATU82537658, which doesn't settle it), and whether VAT is due on agreed or received payments	3.2 J, 6.3	their accountant

14. Acceptance, before launch

Automated tests (Pest or PHPUnit) are part of the build, not extra. At least VAT and rounding with sales, coupons and bundles, the Mollie webhook (paid, authorized, failed, expired, repeated), stock with two orders for the last unit, the five working day count, and every redirect row.

- Every redirect row returns one 301 to `https://www...` then 200. The three same path rows return 200 directly.
- A test order in Mollie test mode for each payment method, paid, shipped, part refunded. A Klarna order goes authorized, then captured when marked shipped, and a rejected Klarna order releases the authorization. Stock moves only on paid or authorized. Replaying the same webhook twice changes nothing the second time.
- VAT on the invoice matches the accountant's rates to the cent, with a coupon and a sale running at once.
- The summary page, both checkboxes and the "Zahlungspflichtig bestellen" button are present, and the order stores the AGB version and both timestamps.
- Every product page shows every food field in section 6.2, in both languages.
- The prototype's own QA bar still holds. Zero console errors, axe clean on every page, no horizontal scroll at 320, 390, 420, 768, 1024 and 1280 px, the 53 interaction checks from the prototype QA pass where they still apply, pages readable without JavaScript.
- office@ receives a test email from outside after the DNS switch, and order emails pass SPF, DKIM and DMARC.
- A backup restored onto staging and the site works from it.
- Invoice and credit note numbers stay gapless when 20 orders are shipped at the same moment (parallel test), and the first document of a new year starts at 1 (test with a frozen clock at 31 Dec 23:59 Vienna).
- Every row of the 3.4 table run once in Mollie test mode, including a Klarna partial ship (capture plus release), a Klarna reject (release), a refund before shipping (stock back, no credit note), a refund that fails (no credit note), a chargeback (flag and alert) and a replayed capture webhook (no second receipt, no second stock booking).
- A coupon limited to one use per customer can't be used twice, and its use comes back after a reject.
- A bundle with two VAT rates produces Mollie lines that Mollie accepts, and an invoice with both rates.
- One month's accountant export opens and imports in their accountant's software without manual fixes.
- A stock count, a production batch in and a damaged item each show up in the product's stock history with the right total.
- A manual order with a payment link is paid in test mode and behaves like a shop order from then on.
- The three owners each change a price, start a sale, ship an order and publish a blog post on their own, with Josh watching and not touching the keyboard.
